Spring XD

Developer Productivity for Data-driven Apps at Scale

Spring XD (co-lead)

Spring XD (co-lead)

Agenda

- Architecture
- Functional Stream Processing
- Spark Streaming and Spark Job
- Kafka and Data Partitions

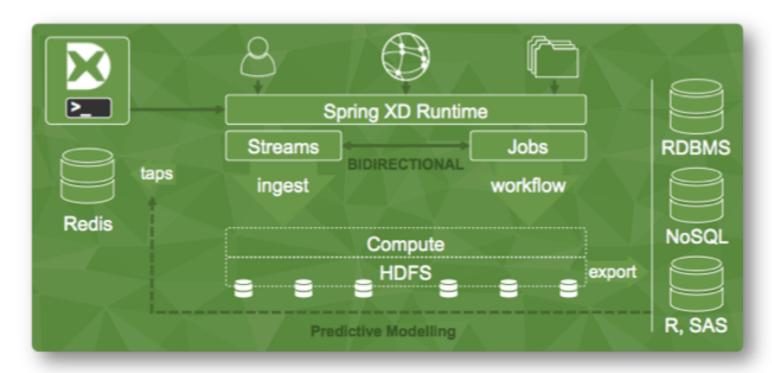

Purpose

- Unified platform for stream and batch workloads
- Evolve streams and jobs in isolation
- Eliminates technical challenges with distributed computing, faulttolerance, or high-availability
- Open and Extensible runtime
- Portable: Runs anywhere there is a JVM
- Read/write Hadoop without integration headaches

Distributed Runtime

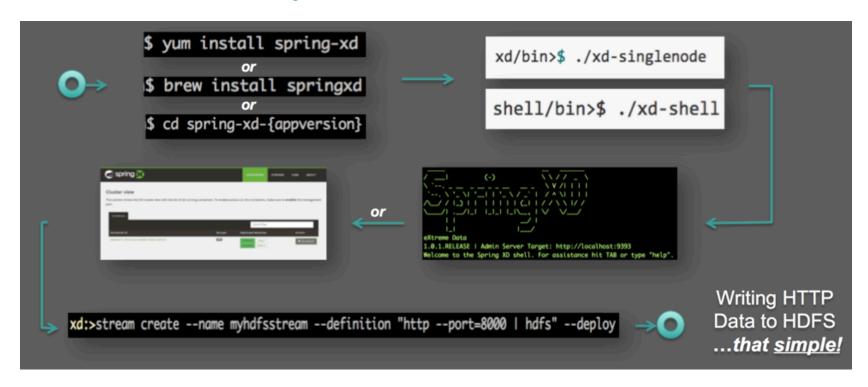

Hadoop without integration headaches...

Easy to Setup and Run

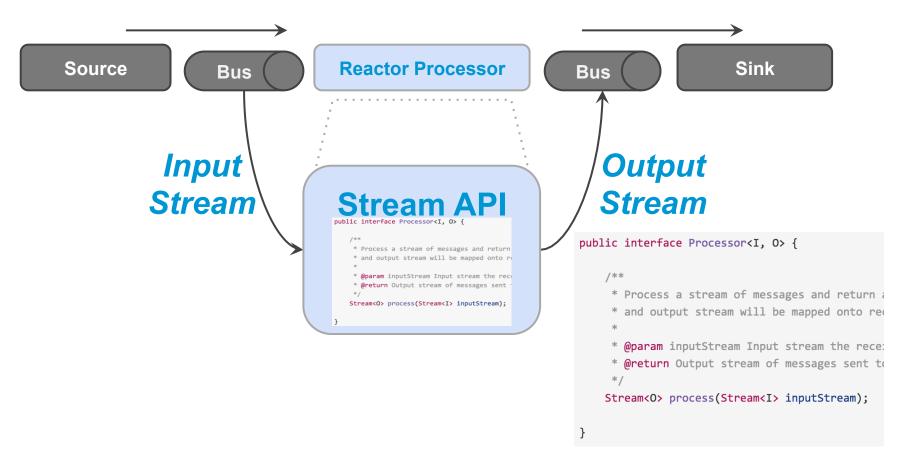

Functional Stream Processing

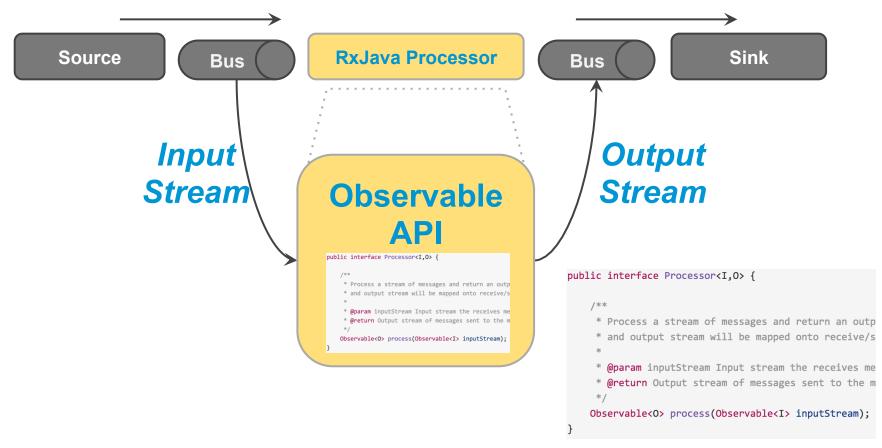

Reactor Stream API

RxJava Observable API

Spring XD + Spark

Spark

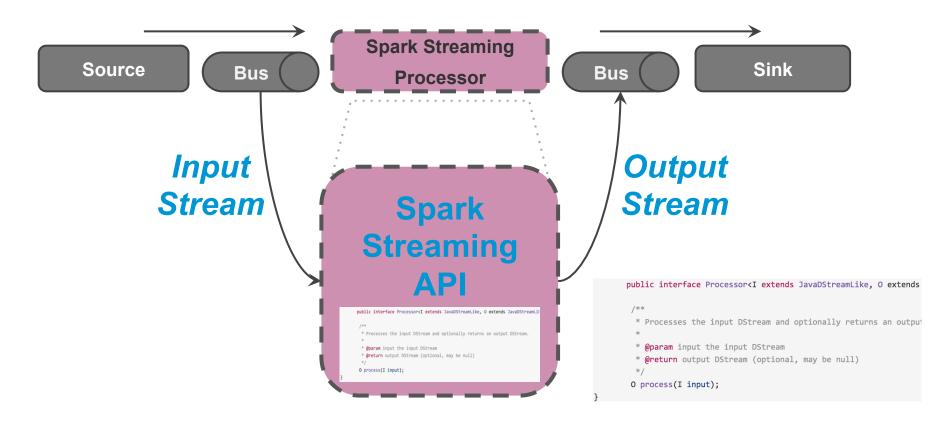

Fast and general engine for large-scale data processing.

What is Spark in Spring XD?

- Leverage OOTB source/sinks from XD and delegate computation logic to Spark cluster
- Automatic failover capabilities in case of Spark Driver failure

Spark Streaming API

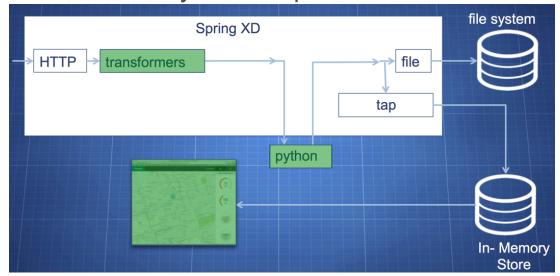

Spring XD + Python

Python

What is Python in Spring XD?

 OOTB 'shell' as processor and sink to execute external shell commands such as a Python script

Spring XD + Kafka

Kafka

Apache Kafka is publish-subscribe messaging rethought as a distributed commit log.

What is Kafka in Spring XD?

- As a message bus to send data from the output of one module to the input of the next module
 - As a source module to ingest data from Kafka topics
 - As a sink module to ingest data into Kafka topics

Looking Ahead

Roadmap

- Custom Modules and HDFS
- UI Canvas:
 - o create, visualize and deploy data pipelines
 - metrics and monitoring capabilities
- Enrichment: OOTB modules/jobs
- Apache Ambari Support
- Security Enhancements
- Spring XD on Pivotal Cloud Foundry (GA Release: May 2015)
